MATHEMATICS 9709/42

Paper 4 Mechanics

February/March 2023

1 hour 15 minutes

You must answer on the question paper.

You will need: List of formulae (MF19)

#### **INSTRUCTIONS**

- Answer all questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do not write on any bar codes.
- If additional space is needed, you should use the lined page at the end of this booklet; the question number or numbers must be clearly shown.
- You should use a calculator where appropriate.
- You must show all necessary working clearly; no marks will be given for unsupported answers from a calculator.
- Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place for angles in degrees, unless a different level of accuracy is specified in the question.
- Where a numerical value for the acceleration due to gravity (g) is needed, use 10 m s<sup>-2</sup>.

#### **INFORMATION**

- The total mark for this paper is 50.
- The number of marks for each question or part question is shown in brackets [ ].

This document has 16 pages. Any blank pages are indicated.

A crate of mass 200 kg is being pulled at constant speed along horizontal ground by a horizontal

1

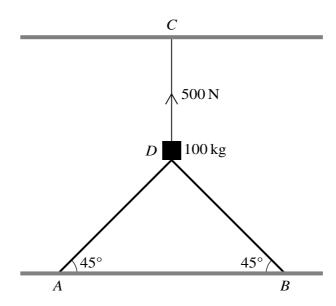

(a)	Find the time that it takes for the crate to move a distance of 15 m.	[2]

trac loco	oy railway locomotive of mass $0.8\mathrm{kg}$ is towing a truck of mass $0.4\mathrm{kg}$ on a straight horizontal k at a constant speed of $2\mathrm{ms^{-1}}$ . There is a constant resistance force of magnitude $0.2\mathrm{N}$ on the omotive, but no resistance force on the truck. There is a light rigid horizontal coupling connecting locomotive and the truck.
(a)	State the tension in the coupling. [1]
<b>(b)</b>	Find the power produced by the locomotive's engine. [1]
The	power produced by the locomotive's engine is now changed to 1.2 W.
(c)	Find the magnitude of the tension in the coupling at the instant that the locomotive begins to accelerate. [5]

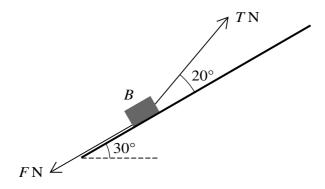

The diagram shows a block D of mass  $100 \,\mathrm{kg}$  supported by two sloping struts AD and BD, each attached at an angle of  $45^\circ$  to fixed points A and B respectively on a horizontal floor. The block is also held in place by a vertical rope CD attached to a fixed point C on a horizontal ceiling. The tension in the rope CD is  $500 \,\mathrm{N}$  and the block rests in equilibrium.

(a)	Find the magnitude of the force in each of the struts $AD$ and $BD$ . [3]	]

(a)

A block B, of mass  $2 \, \mathrm{kg}$ , lies on a rough inclined plane sloping at  $30^\circ$  to the horizontal. A light rope, inclined at an angle of  $20^\circ$  above a line of greatest slope, is attached to B. The tension in the rope is  $T \, \mathrm{N}$ . There is a friction force of  $F \, \mathrm{N}$  acting on B (see diagram). The coefficient of friction between B and the plane is  $\mu$ .

	given that $F = 5$ and that the acceleration of B up the plane is $1.2 \mathrm{ms^{-2}}$ .	
(i)	Find the value of $T$ .	[3]

The diagram shows a smooth track which lies in a vertical plane. The section AB is a quarter circle of radius 1.8 m with centre O. The section BC is a horizontal straight line of length 7.0 m and OB is perpendicular to BC. The section CFE is a straight line inclined at an angle of  $\theta^{\circ}$  above the horizontal.

A particle P of mass 0.5 kg is released from rest at A. Particle P collides with a particle Q of mass 0.1 kg which is at rest at B. Immediately after the collision, the speed of P is  $4 \,\mathrm{m\,s^{-1}}$  in the direction BC. You should assume that P is moving horizontally when it collides with Q.

Show that the speed of $Q$ immediately after the collision is $10 \mathrm{ms}^{-1}$ .	[4]
	•••••
	•••••
	•••••
	•••••
	•••••

When Q reaches C, it collides with a particle R of mass  $0.4 \,\mathrm{kg}$  which is at rest at C. The two particles coalesce. The combined particle comes instantaneously to rest at F. You should assume that there is no instantaneous change in speed as the combined particle leaves C, nor when it passes through C again as it returns down the slope.
